

Movie Theater  
Database

The relationships I chose for the movie theater database make sense because they reflect how they would be connected within a movie theater system. The one-to-many relationship between customers and tickets allows for multiple tickets to be associated with a single customer. The one-to-many relationship between Movie and Tickets allows for multiple tickets to be associated with a single movie and the connection between Tickets and Concessions is one-to-many as well because it shows that you can have multiple concessions associated with a single ticket.
